

9 The table below shows the annual global production of plastics,  $P$ , measured in millions of tonnes per year, for six selected years.

|                       |      |      |      |      |      |      |
|-----------------------|------|------|------|------|------|------|
| <b>Year</b>           | 1980 | 1985 | 1990 | 1995 | 2000 | 2005 |
| <b><math>P</math></b> | 75   | 94   | 120  | 156  | 206  | 260  |

It is thought that  $P$  can be modelled by

$$P = A \times 10^{kt}$$

where  $t$  is the number of years after 1980 and  $A$  and  $k$  are constants.

9 (a) Show algebraically that the graph of  $\log_{10} P$  against  $t$  should be linear.

[3 marks]

9 (b) (i) Complete the table below.

|                                 |      |      |      |    |      |    |
|---------------------------------|------|------|------|----|------|----|
| <b><math>t</math></b>           | 0    | 5    | 10   | 15 | 20   | 25 |
| <b><math>\log_{10} P</math></b> | 1.88 | 1.97 | 2.08 |    | 2.31 |    |

[1 mark]

9 (b) (ii) Plot  $\log_{10} P$  against  $t$ , and draw a line of best fit for the data.

[2 marks]

9 (c) (i) Hence, show that  $k$  is approximately 0.02

[2 marks]

9 (c) (ii) Find the value of  $A$ .

[1 mark]

9 (d) Using the model with  $k = 0.02$  predict the number of tonnes of annual global production of plastics in 2030.

[2 marks]

9 (e) Using the model with  $k = 0.02$  predict the year in which  $P$  first exceeds 8000

[3 marks]

9 (f) Give a reason why it may be inappropriate to use the model to make predictions about future annual global production of plastics.
