

Question	Scheme	Marks	AOs
8(a)	$f(2) = 5(2)^3 - 7(2)^2 - 8(2) + a = 0$ <p style="text-align: center;"><b>or</b></p> $  \begin{array}{r}  5x^2 + 3x - 2 \\  x-2 \overline{) 5x^3 - 7x^2 - 8x + a} \\  \underline{5x^3 - 10x^2} \phantom{+ a} \\  3x^2 - 8x \phantom{+ a} \\  \underline{3x^2 - 6x} \phantom{+ a} \\  -2x + a \\  \underline{-2x + 4} \phantom{+ a} \\  \phantom{-2x + 4} \Rightarrow a - 4 = 0  \end{array}  $	M1	2.1
	$5 \times 8 - 7 \times 4 - 8 \times 2 + a = 0 \Rightarrow a = 4$ * <b>or</b> $a - 4 = 0 \Rightarrow a = 4$ *	A1*	1.1b
		<b>(2)</b>	
(b)	$5x^3 - 7x^2 - 8x + 4 = (x-2)(5x^2 + 3x - 2)$	M1 A1	1.1b 1.1b
	$(x-2)(5x-2)(x+1) = 0 \Rightarrow x = 2, \frac{2}{5}, -1$	dM1 A1	1.1b 1.1b
		<b>(4)</b>	

**(6 marks)**

### Notes

**(a)**

M1: Attempts  $f(2) = 0$ ,  $x = 2$  embedded in the equation set equal to 0 is sufficient. The  $=0$  may be implied by further work. May also attempt to divide  $f(x)$  by  $x-2$ , proceeding as far as a quadratic quotient and a remainder in the form  $a \pm \dots$  which is set equal to 0.

A1\*: Achieves  $a = 4$  with at least one intermediate stage of working and no errors seen, including invisible brackets. If via algebraic division, the quadratic quotient must be  $5x^2 + 3x - 2$

**(b)**

M1: Attempts to find the quadratic factor either via division or inspection.  
If via division score for a quadratic factor  $(5x^2 \pm 3x \pm \dots)$  or via inspection  $(5x^2 \pm \dots x \pm 2)$

A1:  $(5x^2 + 3x - 2)$  which may be seen as the quotient if carrying out algebraic division. Does not need to be written with  $(x-2)$

dM1: Attempts to factorise their quadratic, completes the square or uses the formula to solve their quadratic. Usual rules apply. It is dependent on a quadratic factor having been found. They cannot proceed from the cubic directly to a fully factorised expression.

A1:  $2, \frac{2}{5}, -1$  only

**Note:** Answers **only**, with no working, would score no marks for part (b).
