Notes

(a)

Allow using $\begin{pmatrix} 1 \\ 3 \\ 0 \end{pmatrix}$ instead of $\begin{pmatrix} 1 \\ 0 \\ 3 \end{pmatrix}$ for the method mark.

Way 1

M1: Starts by attempting to find where the two lines intersect. They must set up a parametric equation for line 1 (allow sign slips and as long as the intention is clear), forms simultaneous equations by equating coordinates and attempts to solve to find a value for $t = \dots$ or $\lambda = \dots$.

A1: Shows that there is a unique solution by checking the third equation or shows that the coordinate (3, -2, 7) lies on both lines.

A1: Achieves the correct values $t = 2$ and $\lambda = 1$, checks the third equation and concludes that either

- a common point,
- the lines intersect
- the equations are consistent

therefore, the lines lie in the same plane

Way 2

M1: Finds the vector equation of the plane with the both direction vectors and one coordinate (allow a sign slip), sets equal to the other coordinate, forms simultaneous equations and attempts to solve to find a value for $t = \dots$ or $\lambda = \dots$.

A1: Shows that the other coordinate lies on the plane by checking the third equation.

A1: Achieves the correct values $t = -2$ and $\lambda = 1$ or $t = 2$ and $\lambda = -1$ and concludes that the second coordinate lie on the plane; therefore, the lines lie on the same plane

Way 3

M1: Substitutes line 2 into line 1 and solves a pair of equations to find a value for t . Allow slip with the position of 0 and sign slips as long as the intention is clear.

A1: Solve two pairs of equations to achieve $t = 2$ for each.

A1: Achieves the correct value $t = 2$ and concludes that either

- a common point,
- the lines intersect
- the equations are consistent

therefore, the lines lie in the same plane

Way 4 (Using Further Pure 2 knowledge)

M1: A complete method to find a vector which is normal to both lines and attempts to find the equation of the plane containing one line.

A1: Achieves the correct equation for the plane containing each line.

A1: Conclusion, planes are the same, therefore the lines lie in the same plane.

(b) This may be seen in part (a)

B1: Correct **vector** equation allow any letter for the scalars.

Must start with $\mathbf{r} = \dots$ and uses two out of the following direction vectors $\pm \begin{pmatrix} 1 \\ -1 \\ 2 \end{pmatrix}$, $\pm \begin{pmatrix} 2 \\ -1 \\ 3 \end{pmatrix}$ or

$\pm \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix}$ and one of the following position vectors $\begin{pmatrix} 1 \\ 0 \\ 3 \end{pmatrix}$, $\begin{pmatrix} 1 \\ -1 \\ 4 \end{pmatrix}$ or $\begin{pmatrix} 3 \\ -2 \\ 7 \end{pmatrix}$

(c)

Way 1

M1: Calculates the scalar product between the direction vectors, allow one slip, if the intention is clear

dM1: Dependent on the previous method mark. Applies the scalar product formula with their scalar product to find a value for $\cos\theta$

A1: Correct answer only

Way 2 (Using Further Pure 2 knowledge)

M1: Calculates the vector product between the direction vectors, allow one slip, if the intention is clear

dM1: Dependent on the previous method mark. Applies the vector product formula with their vector product to find a value for $\sin\theta$

A1: Correct answer only
