5.	Two compounds, $X$ and $Y$ , are involved in a chemical reaction. The amounts in grams of these compounds, $t$ minutes after the reaction starts, are $x$ and $y$ respectively and are modelled by the differential equations		
	$\frac{\mathrm{d}x}{\mathrm{d}t}$	$\frac{x}{t} = -5x + 10y - 30$	
	$\frac{\mathrm{d}y}{\mathrm{d}t}$	$\frac{y}{t} = -2x + 3y - 4$	
	(a) Show that		
	$\frac{\mathrm{d}^2}{\mathrm{d}t}$	$\frac{d^2x}{dt^2} + 2\frac{dx}{dt} + 5x = 50$	
			(3)
	(b) Find, according to the model, a general solution for the amount in grams of compound <i>X</i> present at time <i>t</i> minutes.		
			(6)
	(c) Find, according to the model, a general solution for the amount in grams of compound <i>Y</i> present at time <i>t</i> minutes.		
	1 1		(3)
	Given that $x = 2$ and $y = 5$ when $t = 0$		
	(d) find		
	(i) the particular solution for $x$ ,		
	(ii) the particular solution for y.		(4)
			(4)
	A scientist thinks that the chemical reaction will have stopped after 8 minutes.		
	(e) Explain whether this is supported by	y the model.	(1)
