<b>(10 marks)</b>			

(a)

**B1:** Achieves  $2x^2 + 4x + 9 = 2(x \pm k)^2 \pm \dots$  or states that  $a = 2$

**M1:** Deals correctly with first two terms of  $2x^2 + 4x + 9$ .

Scored for  $2x^2 + 4x + 9 = 2(x+1)^2 \pm \dots$  or stating that  $a = 2$  and  $b = 1$

**A1:**  $2x^2 + 4x + 9 = 2(x+1)^2 + 7$

Note that this may be done in a variety of ways including equating  $2x^2 + 4x + 9$  with the expanded form of

$$a(x+b)^2 + c \equiv ax^2 + 2abx + ab^2 + c$$

(b)

**B1:** For a U-shaped curve in any position not passing through  $(0,0)$ . Be tolerant of slips of the pen but do not allow if the curve bends back on itself

**B1:** A curve with a  $y$ -intercept on the +ve  $y$  axis of 9. The curve cannot just stop at  $(0,9)$

Allow the intercept to be marked 9,  $(0,9)$  but not  $(9,0)$

**B1ft:** For a minimum at  $(-1,7)$  in quadrant 2. This may be implied by  $-1$  and  $7$  marked on the axes in the correct places. The curve must be a U shape and not a cubic say.

Follow through on a minimum at  $(-b,c)$ , marked in the correct quadrant, for their  $a(x+b)^2 + c$

(c)(i)

**M1:** Deduces translation with one correct aspect or states  $\begin{pmatrix} 2 \\ -4 \end{pmatrix}$  with no reference to 'translate'.

Allow instead of the word translate, shift or move.  $g(x) = f(x-2) - 4$  can score M1

For example, possible methods of arriving at this deduction are:

- $f(x) \rightarrow g(x)$  is  $2x^2 + 4x + 9 \rightarrow 2(x-2)^2 + 4(x-2) + 5$  So  $g(x) = f(x-2) - 4$
- $g(x) = 2(x-1)^2 + 3$  New curve has its minimum at  $(1,3)$  so  $(-1,7) \rightarrow (1,3)$
- Using a graphical calculator to sketch  $y=g(x)$  and compares to the sketch of  $y=f(x)$

In almost all cases you will not allow if the candidate gives two **different types of transformations**.  
Eg, stretch and .....

**A1:** Requires both 'translate' and  $\begin{pmatrix} 2 \\ -4 \end{pmatrix}$ , Allow 'shift' or 'move' instead of translate.

So condone "Move shift 2 (units) to the right and move 4 (units) down

However, for M1 A1, it is possible to reflect in  $x=0$  and translate  $\begin{pmatrix} 0 \\ -4 \end{pmatrix}$ , so please consider all responses.

**SC:** If the candidate writes translate  $\begin{pmatrix} -2 \\ 4 \end{pmatrix}$  or "move 2 (units) to the left and 4 (units) up" score M1 A0

(c)(ii)

**M1:** Correct attempt at finding the maximum value (although it may not be stated as a maximum)

- Uses part (a) to write  $h(x) = \frac{21}{2(x+1)^2 + 7}$  and attempts to find "their 7"
- Attempts to differentiate, sets  $4x+4=0 \rightarrow x=-1$  and substitutes into  $h(x) = \frac{21}{2x^2 + 4x + 9}$
- Uses a graphical calculator to sketch  $y=h(x)$  and establishes the 'maximum' value  $(...,3)$

**A1ft:**  $0 < h(x) \leq 3$  Allow for  $0 < h \leq 3$   $(0,3]$  and  $0 < y \leq 3$  but not  $0 < x \leq 3$

Follow through on their  $a(x+b)^2 + c$  so award for  $0 < h(x) \leq \frac{21}{c}$
