Notes

Choose the mark scheme that best matches their chosen method.

(a) **Way 1**

M1: Attempts to complete the square. Award for sight of $x=(t+3)^2 \pm ...$ where $... \neq 0$

M1: Rearranges their $x=(t+3)^2-25$ to either $(t+3)=...$ or $(t+3)^2=...$ and then substitutes correctly their expression into the parametric equation for y. So e.g., $t=\sqrt{x+25}-3 \rightarrow y=6\ln\left(\sqrt{x+25}-3\right)$ is M0.

A1cso: $y=3\ln(x+25)$ including brackets with all stages of working shown. The "$y=$" must appear at some point.

Way 2

M1: Attempts to use the power rule for logarithms $y=6\ln(t+3)=...\ln(t+3)^2$ where $... \neq 6$

M1: Writes $y=6\ln(t+3)$ as $3\ln(t+3)^2$ and then multiplies out and substitutes correctly in for t to obtain a Cartesian equation for C

A1cso: $y=3\ln(x+25)$ including brackets with all stages of working shown. The "$y=$" must appear at some point.

Way 3

M1: Attempts to make t the subject for $y=6\ln(t+3)$ to obtain $t=e^{\frac{y}{6}} \pm ...$ where $... \neq 0$

M1: Substitutes $t=e^{f(y)} \pm ...$ correctly into $x=t^2+6t-16$ and rearranges to make y the subject.

A1cso: $y=3\ln(x+25)$ including brackets with all stages of working shown. The "$y=$" must appear at some point.

Way 4

M1: Attempts to complete the square. Award for sight of $x=(t+3)^2 \pm ...$ where $... \neq 0$

M1: Attempts to find $\frac{dy}{dx}$ where $\frac{dy}{dx}=\frac{\left(\frac{...}{t+3}\right)}{at+b}$, $a,b \neq 0$ and uses the completed square form to find $\frac{dy}{dx}$ in terms of x and then integrates to obtain a Cartesian equation for C

A1cso: A complete method using any correct point on the curve to show that $c=0$ and obtain $y=3\ln(x+25)$ with all stages of working shown. The "$y=$" must appear at some point.

Note that a common incorrect approach in (a) is:

$$x=t^2+6t-16=(t-2)(t+8) \Rightarrow x=t-2 \Rightarrow t=x+2 \Rightarrow y=6\ln(x+5)$$

which scores no marks.

(b)

B1ft: Deduces $y=3\ln 25$ oe e.g $y=6\ln 5$ but allow follow through on their Cartesian equation with $x = 0$ and apply isw after a correct value or ft value for y

M1: Attempts to find $\frac{\mathrm{d}y}{\mathrm{d}x}$ when $x=0$ so score for obtaining $\frac{\mathrm{d}y}{\mathrm{d}x}=\frac{\ldots}{x+"25"}$ and substituting in $x=0$

Allow this mark if they use the letters A and B e.g. $\frac{\mathrm{d}y}{\mathrm{d}x}=\frac{\ldots}{x+B}=\frac{\ldots}{0+B}$ or allow a "made up" A and B.

or

Attempts to find $\frac{\mathrm{d}y}{\mathrm{d}x}$ when $t=2$ by finding $\frac{\frac{\mathrm{d}y}{\mathrm{d}t}}{\frac{\mathrm{d}x}{\mathrm{d}t}}=\frac{\left(\frac{6}{t+3}\right)}{2t+6}\Rightarrow\frac{\frac{6}{5}}{2\times2+6}\quad\left(=\frac{6}{50}=\frac{3}{25}\right)$

For the derivative look for $\frac{\mathrm{d}y}{\mathrm{d}x}=\frac{\left(\frac{\ldots}{t+3}\right)}{at+b}$ oe e.g. $\left(\frac{\ldots}{t+3}\right)\times\frac{1}{at+b}\quad a,b\neq0$

NOTE if candidates find $\frac{\frac{\mathrm{d}y}{\mathrm{d}t}}{\frac{\mathrm{d}x}{\mathrm{d}t}}=\frac{\left(\frac{6}{t+3}\right)}{2t+6}=\frac{6(2t+6)}{t+3}=12$ we will give BOD that $t = 2$ has been used unless there is clear evidence that $t = 2$ has not been used.

dM1: Attempts to find the equation of the tangent. Score for sight of $y-"3\ln 25"="\frac{3}{25}"(x\{-0\})$ or if they use $y=mx+c$ they must proceed as far as $c = \ldots$ **It is dependent on the previous method mark.** Must have numeric A and B now.

A1: $25y-3x=150\ln 5$ or any integer multiple of this equation in the form $ax+by=c\ln 5$
